QuantSFC: Developer Change List

Prepared 24 Oct 2026 | Scope: 12 changes, desktop web. Mobile-specific fixes are excluded.

> Implement every change below as written. Each item states the required behaviour and a "Done when" check. Items 1 to 6 are the launch blockers; items 7 to 12 follow.

1 One calculation method for Greeks and IV, platform wide

Use a single shared function for IV and Greeks in the options chain, Greeks, Implied Volatility, Probability and Payoff Simulator. Remove every other copy of the formula.

Input	Indices	Stocks
Underlying price	Spot index value (not futures)	Matching stock futures price
Risk-free rate	5.5%	0.01%
Dividend yield	1%	0%

- Solve IV for each strike from that strike's own closing price. Show call IV and put IV separately. Today they are identical at every strike.
- One contract must show one IV everywhere. Example: NIFTY 22900 CE shows 16.92% in the chain and 11.07% on the IV page today. Both must match after the change.
- Remove the old defaults of 10% interest and 10% dividend from every screen and calculation.

Done when: one contract returns the same IV and Greeks on the chain, Greeks, IV, Probability and Payoff pages, and call and put IV differ per strike.

2 Days to expiry, platform wide

- Count calendar days from today's date in IST to the expiry date. Do not count from the EOD data date.
- Example: 21 Oct to 27 Oct is 6 days. The platform shows 8 today.
- Show the valuation date next to the days-to-expiry value on every tool that uses it.

Done when: every tool shows the same days-to-expiry for a given expiry and displays the valuation date.

3 Index ticker and dashboard Home show the wrong gain/loss

- All six indices show a gain for 19 Oct, but the actual move was a loss. The previous-close reference is wrong.
- Compute change as today's close minus the close of the previous trading day, and the percentage on that same base.
- Skip weekends and NSE exchange holidays when finding the previous trading day (20 Oct was a holiday).
- Apply this to both the ticker and the dashboard Home cards. Colour and sign (+ or -) must follow the corrected value.

> **Done when:** the 19 Oct move for all six indices shows as a loss with the right sign and colour, on the ticker and on Home.

4 Blank pages when opening tools from the sidebar

- Probability and Implied Volatility open with empty data (all zeros) and fill only after a tab switch or a full page reload. Fetch and render data whenever the route becomes active, not only on first page load.
- Greeks opens in Custom mode with no strike and ₹0.00 premiums. Open it in EOD mode with the ATM strike pre-filled and premiums populated.
- Apply the same fix to any other tool that shows an empty state after sidebar navigation.

> **Done when:** each tool shows data on the first open from the sidebar, without a reload or tab switch.

5 Remove the landing site, make the dashboard the home page, fix 404s

- Remove the public Home, About, Services, Blog and Contact pages. This also removes the hard-coded "LIVE" NIFTY 24,812.35 card, the "superior returns" line and the stale blog posts.
- `/` opens the dashboard.
- 301 redirect the old paths (`/about`, `/services`, `/blog`, `/contact`, and the old landing path) to `/`.
- Keep `/login`, `/register`, `/termsconditions` and `/privacy-policy`.
- Unknown URLs must return an HTTP 404 status (currently 200). Change the 404 page's "Popular pages" links to tool links.
- Remove "live" wording from Login ("Live terminal", "live Greeks", "Live options chain"), Register, the dashboard Home ("live" options chain) and the meta description. Use "daily options chain" or "daily EOD".

> **Done when:** `/` loads the dashboard, old paths return 301 to `/`, an unknown URL returns 404, and no "live" wording remains.

6 Disclaimer

- Add a footer to every page (public and dashboard) with the disclaimer paragraph below and a "Disclaimer" link.
- Create a `/disclaimer` page with the full text below. It currently returns the 404 page.
- Add a required acknowledgement checkbox on Register. Block account creation until it is ticked. Label: "I have read and accept the Disclaimer", linking to `/disclaimer`.

Footer text:

> SFC Quant is a market-analytics platform for Indian equities. It is not investment advice, and we are not registered with SEBI as an investment adviser or research analyst. Backtests are hypothetical, and past performance does not predict future results.

Full text for the /disclaimer page:

> SFC Quant is a market-analytics platform for Indian equities. It is not investment advice, and we are not registered with SEBI as an investment adviser or research analyst. Backtests are hypothetical, and past performance does not predict future results.
>
> 9 out of 10 individual traders in the equity Futures and Options segment incurred net losses. On average, loss makers registered a net trading loss close to ₹50,000. Over and above the net trading losses incurred, loss makers expended an additional 28% of net trading losses as transaction costs. Those making net trading profits incurred between 15% and 50% of such profits as transaction costs.

Done when: the footer and link appear on every page, `/disclaimer` renders the full text, and Register cannot be submitted without the checkbox.

7 Placeholder pages: Price Alerts and Blog & Reports

- Hide both from the sidebar and from the Home quick links until further notice.
- Direct URLs to these pages must also not show empty placeholder content (redirect to `/`).

Done when: neither page is reachable from any menu or link.

8 Max Pain

- The Max Pain tile shows "–". Compute it from the option chain data of the selected expiry.
- For each candidate strike K, total payout = sum over all strikes S of: Call OI(S) × max(K − S, 0) + Put OI(S) × max(S − K, 0). Max Pain is the K with the lowest total payout.
- Recompute when the expiry or underlying changes.

Done when: the tile shows a strike value for every underlying and expiry that has OI data.

9 Support / Resistance tiles

- Rename "Support" to "Highest Put OI" and "Resistance" to "Highest Call OI". Each tile shows the strike with the highest put (or call) open interest.
- Add a one-line tooltip on each, for example: "Strike with the highest put open interest for this expiry."

> **Done when:** the old labels are gone everywhere and both tooltips display.

10 Label the price each tool uses

- The chain shows LTP 169.20, while Greeks and IV use settlement 169.90 for the same contract.
- Show a clear price label beside the price on every tool: "LTP" or "Settle price (EOD)".
- Use identical wording in the chain and the Payoff Simulator (Payoff currently says "BhavCopy settle" while the chain shows LTP).

> **Done when:** every price shown on every tool carries a label, and the wording matches across the chain and Payoff.

11 Expiry list date format

- The expiry list shows "28 Sept 2027". Use the three-letter month used everywhere else: "28 Sep 2027".
- Check all dropdowns and labels for any other "Sept" occurrence.

> **Done when:** every date on the platform uses the same format.

12 Guest greeting

- Replace "Welcome back, Trader" with "Welcome to QuantSFC" for guests (users who are not signed in).

> **Done when:** guests see the new greeting and signed-in users are unaffected.
